## Research Interests

I am interested in using machine learning to model large scale population dynamics of endangered or difficult-to-study species. These ecological problems provide a unique motivation for novel advancements in machine learning and graphical models. My current projects include probabilistic inference for latent variables with countably infinite support (particularly time series of abundance) applied to moth, butterfly and salamander datasets and a continent-scale model of bird migration using Doppler weather radar data. Additionally, I am interested in citizen science, probabilistic graphical models, and inference in graphical models.

## Education

**2013 -** University of Massachusetts, Amherst  
**2019** MS/PhD in Computer Science (in progress)

**2006 -** University of MD, Baltimore County  
**2010** BSc in Computer Science  
GPA: 3.7  
Honors College  
Cum Laude

## Work Experience

**Sum 2016** Visiting Researcher  
*Smithsonian Conservation Biology Institute*

Summer appointment studying statistical methods for animal movement modeling. Animals with GPS collars provided a rich dataset of animal behaviors and movement, from which we were interested in estimating range requirements and interaction dynamics between individuals, populations, and species.

**Spr 2016** Visiting Lecturer  
*Mt Holyoke College*

Taught Artificial Intelligence as a senior level undergraduate elective with a class of 15 students.

**2013 -** Research Assistant  
**present** *UMass, MLDS Lab*

My supported project with MLDS has been the Birdcast project, a collaborative project with the Cornell Lab of Ornithology that aims to model and forecast bird migration in the continental US using the NEXRAD system of Doppler weather radar. I developed a supervised learning system for distinguishing migration events from weather events in the radar datastream. I am also working on a regression technique which can forecast the quantity of nocturnal migrants using a combination of radar measurements and climatological forecasts.

**2012 -** Lecturer  
**2013** *University of MD, Baltimore County*

In the 2012-2013 academic year, I became a full-time lecturer at UMBC, teaching 4 sections total of the courses described above. In general, I had a lot of freedom over my courses, with a faculty advisor to consult as needed.

**2008 -** Research Assistant  
**2012** *UMBC, MAPLE Lab*

Worked on several research projects including a natural language grounding project for robotics, a generic error model for machine learning classifiers, and optimization in multi-agent systems. During my time in MAPLE, I also had an advisory role with many undergraduate students working with the lab.

**2011** Intern  
*SRA International*

Designed a Hadoop implementation of Particle Swarm Optimization and applied it to a classified data mining application.

**2007 -** Intern  
**2010** *Johns Hopkins University Applied Physics Lab*

Worked on a graph based wrapper for SQL queries in intelligence analysis we called Graph Query Language (GQL). Also developed ground software for visualizing and controlling systems on board the STEREO satellite mission.

## Teaching Experience

**Spr. 2016** CS 334: Artificial Intelligence  
*Mt. Holyoke College*

Senior level elective covering several topics in artificial intelligence, including search, planning, game theory, reinforcement learning and machine learning. For the second half of the semester, students worked in pairs to design and build AI agents to solve a game or puzzle of their choice. This was a small class of 15 students, taught by me with no TA and using updated material from my previous time offering this course at UMBC in 2012.

**Spr. 2013** CMSC 341: Data Structures  
*University of Maryland, Baltimore County*

Gateway computer science course transitioning students from thinking about code to designing systems and algorithms, with an introduction to asymptotic analysis and an object-oriented approach to data structures for queues, trees, heaps, and hash tables.

For this course, I taught 2 of 4 sections, with a senior professor coordinating/administering the 4 sections. I developed my lecture material, but the syllabus, assignments, and exams were standardized. We had 2 TAs between the 4 sections.

CMSC 203: Discrete Structures  
*University of Maryland, Baltimore County*

Required computer science course on mathematics for computer science focusing on proof techniques, logic, graph theory, combinatorics, and probability theory.

For this course, I taught 1 of 3 independent sections, and had full control over the syllabus, lectures, assignments, and exams. I had one TA.

Fall 2012 CMSC 471: Introduction to Artificial Intelligence  
*University of Maryland, Baltimore County*

Elective computer science course covering a wide array of topics in artificial intelligence, including search, planning, game theory, knowledge representation, logic, and machine learning. The course also served as a first introduction to functional programming with LISP. For this course, I taught the only section, building off of material from previous years' offerings.
